

# Environmental Management Review

## Record of Decision

Fire safety deserves attention. A large fire in C-A may have a significant environmental impact. Continue to ensure environmental impacts of fire are submitted with ESH-related or infrastructure-related Activity Data Sheets; especially ADSs related to the fire-detection system.

Continue to work at defining and allocating resources to remove legacy materials. For example, arrange to dispose of the SREL magnet.

Meet with the Environmental Restoration Division and review the EE/CA recommendations for the g-2 plume. Close out the Action Memorandum with the EPA by the targeted date.

Bring forward to upper management the following lab-wide issues:

BNL desperately is in need of a second Fire Safety Engineer.

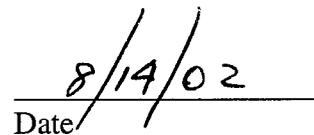

For greater efficiency, individual Department/Division 90-day storage areas should be combined into one 90-day storage area located in the Waste Management facility.

BNL should examine and reduce waste management costs in a manner that reflects the actual cost of efficient waste handling and disposal.

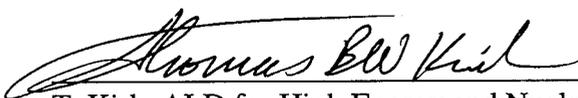

SBMS should be modified such that external construction projects impacting a Department/Division would require Department/Division active involvement in the design, planning and approval process.

D. Lowenstein, C-A Department Chairman
